Python for Engineers

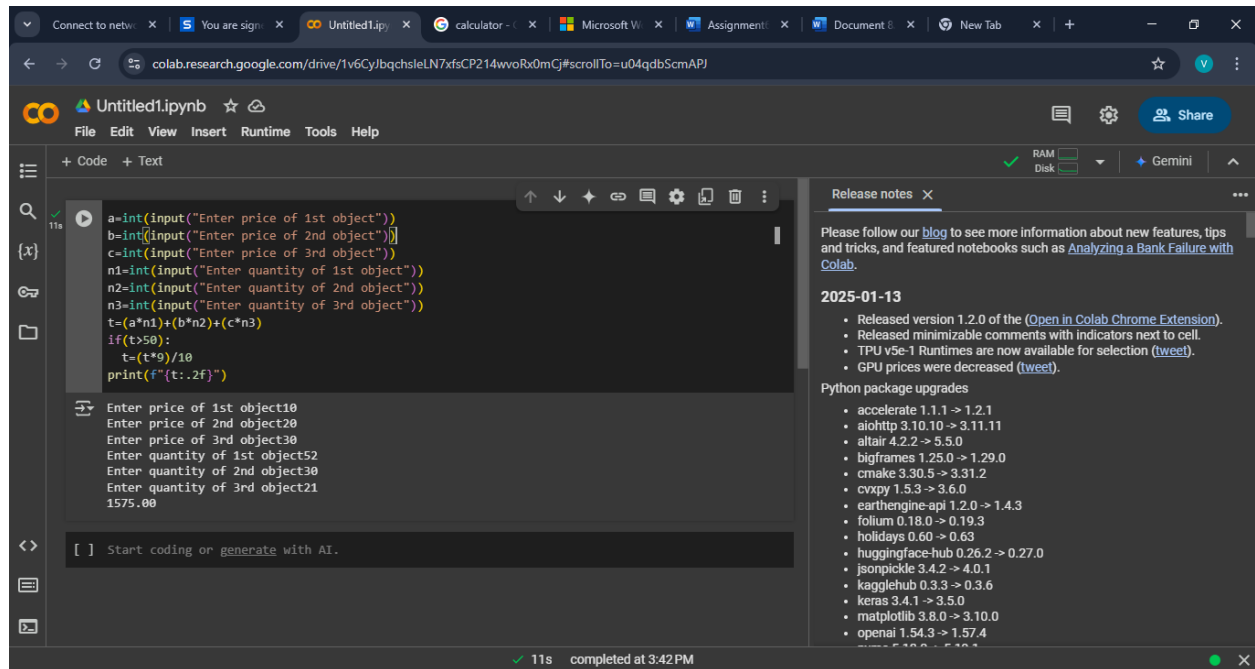

Case Study 1:

Calculate the total cost of 3 different items (from user input). Add a discount of 10% if the total cost exceeds \$50.

Program Code:

```
a=int(input("Enter price of 1st object"))
b=int(input("Enter price of 2nd object"))
c=int(input("Enter price of 3rd object"))
n1=int(input("Enter quantity of 1st object"))
n2=int(input("Enter quantity of 2nd object"))
n3=int(input("Enter quantity of 3rd object"))
t=(a*n1)+(b*n2)+(c*n3)
if(t>50):
    t=(t*9)/10
print(f"{t:.2f}")
```

Output:

The screenshot shows a Google Colab notebook titled "Untitled1.ipynb". The code in the notebook is as follows:

```
a=int(input("Enter price of 1st object"))
b=int(input("Enter price of 2nd object"))
c=int(input("Enter price of 3rd object"))
n1=int(input("Enter quantity of 1st object"))
n2=int(input("Enter quantity of 2nd object"))
n3=int(input("Enter quantity of 3rd object"))
t=(a*n1)+(b*n2)+(c*n3)
if(t>50):
    t=(t*9)/10
print(f"{t:.2f}")
```

The output of the code is:

```
Enter price of 1st object10
Enter price of 2nd object20
Enter price of 3rd object30
Enter quantity of 1st object52
Enter quantity of 2nd object30
Enter quantity of 3rd object21
1575.00
```

The notebook interface includes a left sidebar with navigation icons, a top menu bar with options like File, Edit, View, Insert, Runtime, Tools, and Help, and a right sidebar with a "Release notes" section. The status bar at the bottom indicates "11s completed at 3:42 PM".
